چکیده:	
<p>Hymenopterous parasitoids are considered as the most important agents to canfort sunn pest in Iranian cereal fields.</p> <p>An attempt has been realized to determine the scelionid fauna on the eggs of this vary harmful insect in the region of Isfahan .</p> <p>Determinmation has been done , on the base of Kozlov (1988) and Masner (1980), To collected these tiny insects , we applied sweep net as the main means.</p> <p>Collection has been done during 1997 , 1998 and 1999 all over the province. All kinds of crops have been visited including cereals , alfaalfa , rice and various ornamental and fruit trees as well.</p> <p>Two species , Trissolcus agriope Kozlov and and T. djadeshko Rjachovsky have been found as new for Iranian fauna.</p> <p>Another species Trissolcus sp . is considered to be a new one for the world . As it was expected , T. vassilievi has not been observed in the region of Isfahan .</p>
